

Supplementary Figure 1: Timeline of APSIM model simulations showing how leaching was summed up over one year of continuous maize and over both years of the maize-soybean 2-year rotation.

Supplementary Figure 2: Model calibration for yield data (solid blue line) relative to a 1:1 reference line (dotted black line). All yield data from experiments were reported annually with the exception of IN2 which only reported a 6-year average for each tile spacing treatment. The corresponding simulated yield data were output for each year of the experiments and so, captured the variability in yield from year to year discussed by the authors of IN2 [47].

Supplementary Figure 3: Model calibration for drainage data (solid blue line) relative to a 1:1 reference line (dotted black line). All drainage data were both reported and simulated for each experimental year.

Supplementary Figure 4: Model calibration for flow-weighted NO3-N data (solid blue line) relative to a 1:1 reference line (dotted black line). All flow-weighted nitrate data were both reported and simulated for each experimental year with the exception of MI which reported a 3-year average [43].

Supplementary Figure 5: Model calibration for NO_3 -N leaching load data (solid blue line) relative to a 1:1 reference line (dotted black line). All nitrate leaching data were both reported and simulated for each experimental year with the exception of MI which reported a 3-year average [43].

Supplementary Figure 6: Cumulative grain yield of modelled experiments in which measured yield data was available. Points are real data and lines are simulated data.

Supplementary Figure 7: Cumulative drainage of modelled experiments in which measured drainage data was available. Points are real data and lines are simulated data.

Supplementary Figure 8: Cumulative NO_3 -N leaching of modelled experiments in which measured leaching data was available. Points are real data and lines are simulated data.

Supplementary Figure 9: Distribution plots of AONR values in study sites.

Supplementary Figure 9: AONR (kg N/ha) calculated using the bi-linear model plotted against AONR (kg N/ha) calculated using the quadratic plateau model for each system (Continuous Maize (solid red line; y=1.5x-0.2) and Maize-Soybean Rotation (dashed blue line; y=2.2x-56.3) relative to a 1:1 reference line (dotted black line).

Leaching per unit maize yield is minimized at fertizer rates lower than leaching breakpoint

Supplementary Figure 10: Yield-scaled leaching response to increases in Nitrogen fertilizer rate in continuous maize (left) and the two-year maize-soybean rotation (right). Colors correspond to the different sites. The black line is the average modeled response. The red dashed vertical line is the leaching breakpoint.

Supplementary Table 1: Overview of the published studies used in this modeling study

Supplementary Table 3: Soil data summary for modeled sites. Abbreviations: BD is the bulk density, LL is the soil water lower limit (wilting point), DUL is the soil water upper limit (field capacity), SAT is the soil water holding capacity (saturated), KS is hydraulic conductivity, OM is organic matter, F-inert is the fraction of organic matter is stable/cannot be broken down, pH refers to the soil's acidity/alkalinity level.
